

Vehicle Traceability System

STV COCOON
by ambimetrics

AMBIMETRICS presents STV at GOFAR TOUR:

The first step towards the robotization of agricultura

AMBIMETRICS will participate in GOFAR TOUR to present its STV system (Vehicle Traceability System), currently in the **pilot phase**.

STV represents the first real step towards the digitalization of field operations, enabling traditional machinery to be transformed into connected, intelligent, and future-ready equipment.

Based on IoT technology, the system allows real-time monitoring and analysis of machinery activity, providing full traceability, operational control, and remote supervision. Its design ensures easy integration into existing equipment, without the need to replace machinery.

During the event, AMBIMETRICS will open its pilot program to farmers, cooperatives, and service companies willing to validate this technology under real working conditions.

Participating in this experience allows you to:

- Improve operational efficiency
- Monitor your fleet in real time
- Detect and prevent incidents
- Make data-driven decisions

The goal is clear: digitalize the field today to prepare for automation and the use of robots tomorrow.

Open invitation

GOFAR TOUR attendees will have the opportunity to experience the STV system live and join this **pilot program**.
